Usage of any items from the University of Cumbria's institutional repository ‘Insight’ must conform to the following fair usage guidelines.

Any item and its associated metadata held in the University of Cumbria’s institutional repository Insight (unless stated otherwise on the metadata record) may be copied, displayed or performed, and stored in line with the JISC fair dealing guidelines (available here) for educational and not-for-profit activities provided that

• the authors, title and full bibliographic details of the item are cited clearly when any part of the work is referred to verbally or in the written form

• a hyperlink/URL to the original Insight record of that item is included in any citations of the work

• the content is not changed in any way

• all files required for usage of the item are kept together with the main item file.

You may not

• sell any part of an item

• refer to any part of an item without citation

• amend any item or contextualise it in a way that will impugn the creator’s reputation

• remove or alter the copyright statement on an item.

The full policy can be found here. Alternatively contact the University of Cumbria Repository Editor by emailing insight@cumbria.ac.uk.
Patient obesity and the practical experience of the medical imaging professional: An interpretative phenomenological analysis

Amanda Woods*, Paul K. Miller & Charles Sloane

www.cumbria.ac.uk
*amanda.lou09@live.co.uk

The rising tide of obesity in the West affects all socioeconomic groups, ages and genders (WHO, 2014). Coronary heart disease, diabetes mellitus, osteoarthritis and respiratory problems are, moreover, all (a) worsened by obesity, and (b) contributors to workload in radiology departments (Shah et al, 2011). While there is ample evidence regarding the function of medical imaging in helping obese (bariatric) patients (Lee, McAlexander and Banda, 2011), however, there remains limited formal research into the practical ways in which patient obesity impacts upon the nuanced everyday practice of professional radiographers.

Method

Interpretative Phenomenological Analysis (IPA) was used to explore the everyday practical issues faced by medical imaging professionals when handling the cases of bariatric patients. Employing a sample of N=8 such professionals, with 5-35 years of front-line experience, open-ended, semi structured interviews were conducted (mean duration = 30 minutes). The questioning itself progressed from descriptive to analytical and evaluative. Data were analysed in line with the standard idiographic techniques of IPA (Smith, Flowers & Larkin, 2009). Analysis revealed four superordinate themes, outlined below.

<table>
<thead>
<tr>
<th>I. “Unsuitable” Kit</th>
<th>II. Diagnostics</th>
</tr>
</thead>
<tbody>
<tr>
<td>“[S]ometimes we are unable to use the hydraulics on the table.”</td>
<td>“Image quality is decreased due to scatter in large patients...you are unable to exclude a fracture because image quality is so bad and so much quantum mottle...”</td>
</tr>
<tr>
<td>“Sometimes fitting them on the image receptor can be difficult, so when we’ve got someone for a chest, we may end up actually doing two exposures.”</td>
<td>“[W]ith a chest you have to use a grid straight off, if you see an obese patient.”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>III. Practical Motion</th>
<th>IV. Communicative Stigma</th>
</tr>
</thead>
<tbody>
<tr>
<td>“[S]ometimes they struggle to move into the position that we need, sometimes you’ve got to compromise...”</td>
<td>“[I]t was a bit embarrassing at the time, probably for her as well. [H]ow do you bring up some of these things, you know?”</td>
</tr>
<tr>
<td>“I think probably one of the biggest problems we’ve had...is actually sitting the patient forwards and placing the receptor behind them.”</td>
<td>“Actually we’re embarrassed, I was embarrassed to bring the subject up.”</td>
</tr>
</tbody>
</table>

Radiology departments need to effectively prepare for imaging bariatric patients in order to reduce the number of repeated projections, missed diagnosis and embarrassing situations for the professional and patient alike (see also Buckley et al., 2009). However, given the still-rising rates of obesity in the UK and elsewhere in the West, it may be necessary to incorporate some aspects of bariatric medicine into core education in medical imaging – not least that relating to practical communication and the handling of awkward topics in real-world contexts.
