Enacting a place-responsive research methodology: walking interviews with educators

Place-based and place-responsive approaches to outdoor learning and education are developing in many countries but there is dearth of theoretically-supported methodologies to take a more explicit account of place in research in these areas. In response, this paper outlines one theoretical framing for place-responsive methodologies for researching outdoor learning and education. We exemplify how this might work in practice with data and analysis from one suggested place-responsive research method, the walking interview. Implications and consequences for how outdoor learning might be researched more widely are explored.

Keywords: Place, place-responsive, walking interview, mobile methodology, outdoor learning, outdoor education.

Introduction

In this article we provide viable theoretical bases for the expression of a place-responsive research methodology. We exemplify what this might mean in practice with a description of one place-responsive research method – the walking interview – and a commentary on how this approach generated data and led to data analysis. We argue that the development of a more place-responsive research methodology is now required as a deeper concern for place becomes more important in expressions of the purposes and practices of outdoor and environmental education (Brookes, 2002; Brown, 2012; Quay and Seaman 2013; Somerville et al, 2009, 2011; Stewart, 2008; Cameron, 2003, Mannion, et al 2011). Our contribution sits within a wider burgeoning concern for the importance of place and mobilities in the social sciences (Cameron, 2003; Casey, 1998,

1
2
3 Thrift, 1999; Urry 2007). Indeed, walking itself, is receiving renewed attention in
4
5 geography and anthropology as both a social practice and as a research method
6
7 (Edensor, 2010; Ingold and Vergunst, 2008; Ingold, 2010,) but its application in place-
8
9 based and place-responsive outdoor and environmental education remains unaided.
10

11
12 We will start by describing how outdoor education and outdoor learning fields are
13
14 increasingly considering place as a key concern. We will delineate what we mean by a
15
16 place-responsive methodology. Within this methodology, we describe the walking
17
18 interview as one example method. In this paper we share three data examples with
19
20 analysis, as ‘vignettes’ produced through this approach. The walking interviews with
21
22 teachers allowed the researcher to take respondents back to the places that both inspired
23
24 their plans for teaching outdoors and the places they subsequently visited with their
25
26 learners. Walking interviews are but one of a possible wider set of methods that could
27
28 be used to operationalize place-responsiveness in research and we hope that our
29
30 contribution will encourage further flourishing of new methods and methodological
31
32 orientations to place which has been a long-standing concern for readers of this journal
33
34 and beyond. We close by summarising what we consider to be the implications of
35
36 taking seriously these key aspects of a place-responsive disposition to research for the
37
38 field of educational research generally and for outdoor, environmental, adventure and
39
40 experiential learning in particular.
41
42
43
44
45
46

47 **Place: a preeminent concern**

48
49 Within the field of outdoor education and learning, ‘place’ has become a preeminent
50
51 concern (Mannion and Lynch, 2016; Quay and Seaman 2013). Writing across a wide
52
53 variety of approaches researchers and theorists are currently taking greater account of
54
55 the importance of place in learning and education outdoors (Ballantyne and Packer,
56
57
58
59
60

1
2
3 2002, 2006, 2009; Beames, Higgins and Nicol, 2012; Bentsen, Mygind and Randrup,
4
5 2009; Brookes, 2002; Harrison, 2010; Higgins and Wattchow, 2012; Mannion, Fenwick
6
7 and Lynch, 2013; Mygind, 2009; Somerville et al, 2009, 2011; Stewart, 2008; Waite
8
9 2011; Wattchow and Brown, 2011).

10
11
12 Place-based education in particular exemplifies this concern with place (Gruenewald,
13
14 2003a, 2003b; Harrison 2010; Woodhouse and Knapp 2000). Place-based education
15
16 brings together concerns found within strands of environmental education, critical
17
18 pedagogy and outdoor and experiential education. It has been developed within a
19
20 variety of orientations; from a psychological and place-attachment approach (Ardoin,
21
22 2006, 2012), to critical approaches to globalisation (Gruenewald and Smith, 2008), and
23
24 a concern with local politics and ‘connectedness’ to the local community (Meichtry and
25
26 Smith, 2007; Smith and Sobel, 2010). Place-based education is not without its critics,
27
28 there are concerns around how ‘place’ is defined, whose ‘notion’ of place takes
29
30 precedent, and how these come about. Nespor (2008) notes that place-based education
31
32 has, at times, overly-simplified notions of community and place. Mannion and Lynch
33
34 (2016) consider all three problems and advocate a less anthropocentric approach to
35
36 place wherein social and ecological aspects are entwined. They ask “in what ways can
37
38 place-responsiveness be a reciprocal eco-social process involving humans and other
39
40 entities?” (Mannion and Lynch, 2016, 90).

41
42
43 Despite the rhetoric around place, only a small number of empirical studies have taken
44
45 place as a target central concern. In Australia, a country of contrasted histories of place
46
47 between the modern and the indigenous populations, Brookes (2002) and Stewart
48
49 (2004) explore the role of place in meaning making in outdoor experiences. Stewart
50
51 (2004) has noted how different epistemological and ontological facets of experiences in
52
53 the outdoors can result in different understanding of places. Ballantyne and Packer
54
55
56
57
58
59
60

1
2
3 (2002; 2006; 2009) have identified the importance of place as a context for sensory
4
5 engagement in teaching strategies outdoors. Tooth and Renshaw, (2009) extend this to
6
7 show that outdoor learning pedagogy should be more attentive to place, especially in
8
9 educating for sustainability. In New Zealand, researchers are acknowledging the
10
11 changing global environment and the importance of pedagogy that includes place
12
13 (Cosgriff, et al 2012; Brown, 2012).
14
15

16
17 The way places are responded to by teachers is also seen as increasingly important. In
18
19 Sweden, Szczepanski (2012) provides an analysis of teachers' perceptions of outdoor
20
21 practice showing, *inter alia*, that they afford eventful opportunities for free discovery
22
23 and sensory experience. Research on 'Udeskole' in Denmark has found that natural
24
25 settings were a catalyst for pedagogical change in teachers' approaches (Bentsen et al,
26
27 2009; Mygind, 2009). In a Scottish context, when teachers' took their outdoor learning
28
29 into natural nature reserves, it was found that teachers' curriculum planning was
30
31 influenced by place and encounters with 'more-than-human' elements such as other
32
33 species, the weather and the challenging terrain (Mannion, Fenwick and Lynch, 2013).
34
35
36

37
38 These examples highlight the pedagogical importance of place in outdoor education and
39
40 learning, but show that theory and research are only beginning to help us understand
41
42 how place gets harnessed into teaching outdoors. In the next section, we will outline our
43
44 understanding of place responsive pedagogy, what counts as 'more-than-human', and
45
46 the connection between these two with the theory and practice of outdoor,
47
48 environmental and adventure education.
49
50

51 52 53 **Place-responsiveness and the 'More-than-Human'**

54
55 Casey provides a theoretical basis for understanding that all of our lived experiences as
56
57 humans are place-based (Casey, 1998) and that to survive and adapt as a species on the
58
59
60

1
2
3 planet we need to respond to the places in which we find ourselves. In a linked manner,
4
5 continental philosophical understandings of place, especially those within
6
7 phenomenology (Malpas, 1999) suggest that we come to understand the world through
8
9 place: “it is, indeed, in and through place that the world presents itself” (*ibid*, 15). Casey
10
11 (1998) notes how it is the body that is the source of all experience in space, and it is the
12
13 movement of that body in space that gives us a way of accessing the world.
14
15

16
17 The lineage of our term ‘place-responsiveness’ can be traced back to John Cameron
18
19 who defined this as the development of “a deep connection with place is an integral
20
21 element of the culture, enabling us to live sustainably within the environment” (2003;
22
23 180). Cameron writes:
24
25

26
27 Place is not the mere passive recipient of whatever humans decide they wish to do
28
29 upon the face of it. The land is an active participant in a very physical sense...it
30
31 [sense of place] includes a growing sense of what the place demands of us in our
32
33 attitudes and actions. (*ibid*, 176).
34

35 We find Cameron’s description of the land as an *active participant* suggestive of a
36
37 worldview that is not singularly humanistic. Cameron notes that this includes being
38
39 open to other person’s stories of place and the other aspects of place beyond merely the
40
41 social. In calling us to ‘learn’ our way via a reciprocal responsiveness between human
42
43 and place he notes “It is learning how to develop ecological literacy, awareness of the
44
45 more-than-human aspects of place openness to other stories of place than one’s own...”
46
47 (*ibid*, 194). In outdoor and environmental education, Mannion, Fenwick and Lynch
48
49 (2013) have argued that a similarly reciprocal place-responsive approach to pedagogy
50
51 can be enacted through involving the distinctive elements found in places into events.
52
53 Place-responsive pedagogy, for them, is based on a dynamic relational view of place
54
55 and people/place interactions and can involve highly educational encounters with the
56
57
58
59
60

1
2
3 'more-than-human' elements. We explain and explore this term next.
4

5
6 The term 'more-than-human' has a lineage within the phenomenological tradition in
7
8 education (Abrams, 1996) but has appeared later, with more in-depth explanation, in
9
10 human geography (Jones, 2013; Whatmore, 2002) and post-humanist accounts of
11
12 learning (Pederson, 2010). Whatmore's explanation of the 'more-than-human' pushes
13
14 us to attend to processes and materials beyond the human, yet includes the human in
15
16 their relations with this materiality of the world and the Earth. Theorising the human
17
18 and the more-than-human in new ways has consequences for both. Whatmore explains:
19
20

21
22 ...So it is that recent contributions [in the field of cultural geography] have sought
23
24 to do (at least) three things. The first has been to re-animate the missing 'matter' of
25
26 landscape, focusing attention on bodily involvements in the world in which
27
28 landscapes are co-fabricated between more-than-human bodies and a lively earth.
29
30 The second has been to interrogate 'the human' as no less a subject of ongoing co-
31
32 fabrication than any other socio-material assemblage. The third in my list has been
33
34 the redistribution of subjectivity as something that 'does not live inside, in the
35
36 cellar of the soul, but outside in the dappled world'... This redistribution of
37
38 energies puts the onus on 'livingness' as a modality of connection between bodies
39
40 (including human bodies) and (geo-physical) worlds. (2006; 603).
41

42
43 Whatmore's contribution seems to challenge humanistic phenomenological accounts of
44
45 place, suggesting that such would offer only a partial understanding of how we interact
46
47 with and through place. Deploying the term 'more-than-human' encourages researchers
48
49 to notice that any account of people and place cannot be merely a product of solely
50
51 human actions. Simply put, since we and our environments continually co-specify one
52
53 another, research should take due account of these place-based, relational and
54
55 assembling processes and how knowing through these processes arises (Ingold, 2011).
56
57 By this view, epistemology and ontology are intertwined. Barad uses the term 'onto-
58
59 epistemology' (Barad 2007) to capture this intertwining of knowing and becoming. As
60

1
2
3 an example, Maurstad et al (2013) use Barad's term *intra-action* to capture how, in their
4
5 study humans and horses meet each other and are both changed through the process.
6
7

8 We draw upon these concepts of place-responsiveness and the more-than-human in our
9
10 framing for our research methodology. Our disposition has resonance with emerging
11
12 post-qualitative positions within the social science (Lather, 2013; St Pierre, 2011, 2014).
13
14 Some 'post-qualitative' researchers are attempting to operationalize how we conduct
15
16 research when we take seriously the idea that we are not separate from the world. St
17
18 Pierre writes that post-qualitative research:
19
20

21
22 *...does not allow the subject/object and human/material oppositions to be thought*
23 *or lived. We are not separate from the world. Being, in every sense is entangled,*
24 *connected, indefinite, impersonal, shifting into different multiplicities and*
25 *assemblages. (St Pierre, 2014; 226).*
26
27
28
29

30 The anthropologist Tim Ingold (2000) draws upon Deleuze and Heidegger, to explain
31
32 further how people-and-place are entangled in assemblages in a contingent unfolding
33
34 interacting process. Ingold argues that people and places are relationally emergent
35
36 through the activities of both people and many other entities and processes that allow
37
38 life to unfold (including the weather, the activities of animals as much as humans) – the
39
40 'more-than-human'. Ingold suggests that all living beings act within a unified field of
41
42 relations within which agency is not located 'in' a person or other entity but is afforded
43
44 through the connections between the assembled beings.
45
46
47
48

49 The consequences for place-responsive research and research on the more-than-human
50
51 are far-reaching. Researchers must collect data on the many elements which make up
52
53 these assemblages which can be physical, social, discursive, material, imaginative or
54
55 cognitive (Renold & Ivinson, 2014). Research processes themselves are inevitably
56
57 another form of assembling too which further challenges some conceptualisations of
58
59
60

1
2
3 objective research. Because research assemblages and those found in the empirical field
4
5 are changing and unstable, they are continually in a state of becoming different. How
6
7 we know and what we learn must, therefore, accrue through reciprocal response making
8
9 by all the entities found within assemblages (see Mannion and Gilbert, 2015). This
10
11 means that place-responsive research methodologies in outdoor and environmental
12
13 education need to look at evidence of events that participate in this process of becoming
14
15 and create changes in the relevant assemblages. In addition, *educational* researchers
16
17 working with this theoretical framing need to find ways of noticing when and how these
18
19 assemblage relations shift and what the effects are on learners and learning.
20
21
22

23
24 In this research project, one possible method for data collection emerged as a way of
25
26 more explicitly acknowledging the issues outlined above: the walking interview. This
27
28 method is clearly mobile and, as such, was chosen as a way to attend to how the on-
29
30 going processes of the assembled elements continued to produce differences. These
31
32 differences would be experienced through the walking journey by the researcher and the
33
34 respondents who, in this case, were teachers. The walking interview allowed the
35
36 researcher to go with the teachers back to the sites in which they had planned and later
37
38 taught their pupils outdoors. This method proved useful for noticing when and how
39
40 places came and continued to be enmeshed in the intended and experienced curriculum
41
42 of outdoor learning but the experiences of walking also threw up some surprises en
43
44 route which validated the choice to go mobile with data collection. The walking
45
46 method was one of several methods employed within a wider case study design that also
47
48 included artefact interviewing, document analysis, situated interviews (in class and
49
50 school), photography and email journaling. We will show how our approach to walking
51
52 interviews allowed the researcher to witness the creativity of place-responsive educators
53
54 as they worked with the realities of their specific emplaced context. The data also show
55
56
57
58
59
60

1
2
3 how the research process itself can be seen as an event that too unfolds in a place-
4 responsive manner.
5
6

7 8 **Walking as a Research Method**

9
10
11 Researchers have employed walking interviews for a variety of reasons and in different
12 ways across disciplines. Mostly, researchers justify this mobile method because it
13 reveals more or particular kinds of data connected to the locations visited. For some, it
14 is a question of addressing power dynamics. Sin (2003) found that the spatial aspects of
15 interviewing have not been well attended to in social research and argued that the
16 construction of identities, power and knowledge are in a dialectic with the place of the
17 interview. Carpiano (2009) explored the use of 'go along' interviews in researching the
18 health of places and found the 'go-along' interview helped to increase the participation
19 of the interviewee and highlighted the importance of the context of the research
20 interview. Brown and Durrheim (2009) similarly noticed walking interviews increased
21 rapport because the place itself functioned as a co-producer of dialogue. Walking also
22 affords data collection on sensory and affective elements. Knutz and Presnell (2012)
23 advocate the walking interview to show how the embodied aspects can allow us to
24 capture the spoken and affect data on the unfolding event of the walking practice. With
25 similar sensibilities towards embodied and lived experience, Anderson (2004) argues
26 that the walking interview is a way to excavate the 'co-ingredience' of people and place
27 through the lived experiences of where we act out our lives; in place. Hall, Lashua and
28 Coffey (2008), utilised the 'go-along' interview with young people in their study of
29 noise as part of lived everyday life and movement. Spinney (2015), however notes
30 mobile methods can miss the capture of data that is not 'on the move'.
31
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54

55
56
57 For our purposes, we wish to provide a particular theoretical platform for our use of the
58
59
60

1
2
3 walking interview. We have already argued that the human and the more-than-human
4
5 are best understood as intra-acting within a unified relational field of assembled entities.
6
7 In this research, we took walking interviews to be an active intervention in the place-
8
9 making or place assembling process with a view to understanding the effects of those
10
11 very processes. Like all approaches, we would argue, different methods will bring
12
13 different effects on the field of inquiry and influence what is produced through them.
14
15 We are not alone in advancing a relational approach to place in research. In outdoor
16
17 education, Mullins (2014) used a form of hermeneutic phenomenology to research the
18
19 reflective practice of participants on a 100 day wilderness canoe journey. He found that
20
21 skilled practices, social interaction and environmental conditions were co-influential.
22
23 Ross, Renold, Holland, and Hillman (2009) used walking interviews – ‘guided walks’
24
25 that were co-created with respondents – arguing that these journeys were themselves
26
27 place making practices that afforded ways to understand the young people’s everyday
28
29 geographies. Ivinson and Renold (2013) within a multi-method ethnography also used
30
31 walking and ‘situated interviews’ to collect data on young peoples’ lives and places
32
33 emphasising how these were open to future becomings and possibilities. In a similar
34
35 vein, Edensor’s (2010) work used walking and place being thought of as ‘stretched out’
36
37 along linear routes focussed on the rhythm of walking and how as a repetitive motion it
38
39 is a way of thinking and feeling a world ‘in formation’ (2010; 75).
40
41
42
43
44
45
46 Ingold and Vergunst’s (2008) anthropology of walking provides a possible explanation
47
48 for these distinctive effects of walking as a research tool. Importantly, they see walking
49
50 – like other practices – as an action that participates in creating a world that is itself
51
52 already in formation. Walking interviews are one useful and important way of attending
53
54 to our need as researchers to correspond with the flow of events in a place whilst
55
56 collecting data in a participatory way. Lund (2012) views landscapes as commonly
57
58
59
60

1
2
3 'narrated' through the activity of walking: we make our way *through a world-in*
4
5 *formation* not across the mere top of it. Walker and landscape entwine each other.
6
7 Ingold (2011) writes that through modernity the focus changed from our apprehending
8
9 the world through our feet to doing so with our hands and, latterly, with our minds.
10
11 However, it was and is through our feet that we are most significantly and continuously
12
13 connected to the world and this reality may be obfuscated by more mentalist
14
15 constructions of experience. He looks at the process of walking and thinks of walking,
16
17 reading and writing as interconnected activities; Ingold sees walking as a mental
18
19 exercise as well as physical and that there is "constant traffic between these terrains
20
21 [walking and reading], respectively mental and material, through the gateways of the
22
23 senses" (2010, 18). Ingold sees *locomotion not cognition* as key in actively
24
25 apprehending and perceiving the world. Thus, in the approach described here, to walk
26
27 with interviewees, we argue, helps us to correspond with worldly processes they too
28
29 encounter. All the while, both interviewer and interviewee are apprehending the world
30
31 as it unfolds and emerges and co-responding to/with it. We seek to document, therefore,
32
33 how the world is relationally apprehended through the following assembled narrative
34
35 accounts of human-with-more-than-human intra-actions. These accounts are best seen
36
37 as productive witness testimonies that will we trust evoke meanings with readers rather
38
39 than providing one fixed representation of these events.
40

45

46 **Method in Practice: Walking Interviews in Place**

47
48
49 The data examples documented in this paper come from an on-going research project on
50
51 the role of place (with a particular focus on the 'more-than-human' elements) in
52
53 teachers' planning and enactment of education in outdoor settings. The data here come
54
55 from a set of five teacher-focused case studies which are seen as place-based
56
57 'assemblages'. Each assemblage comprised the teacher, their places for outdoor
58
59
60

1
2
3 teaching, and the processes they used to plan for this teaching. Each teacher was visited
4
5 twice to complete walking interviews. This paper shares exemplars from the walking
6
7 interviews and associated photographs and fieldnotes only though other methods were
8
9 used in tandem. The walking interviews were arranged so that the educators could take
10
11 the researcher back to the very places in which they had taken their learners for regular
12
13 outdoor educational experiences. By default, these were also the places that educators
14
15 had usually visited ahead of taking their pupils in order to plan the outdoor educational
16
17 excursions. On these walking interviews, the researcher sought to gain evidence of how
18
19 the educators went about planning and enacting their teaching and to inquire into when,
20
21 if and how elements of the place featured in this unfolding process. In this paper, we
22
23 particularly focus on the ways in which this data collection method allowed for
24
25 encounters with the more-than-human to be elucidated.
26
27
28

29
30 The walking interviews were approximately two hours long and audio recorded
31
32 throughout. In addition, photos were taken of place elements that were regarded as
33
34 significant or evoked key past, present, and possible future teaching events. Data came
35
36 in two related ways. One strand of data was about past events while other data captures
37
38 unexpected events – for example encounters with animals or their tracks – that
39
40 transformed the walking interview itself through changing its focus. Walking interviews
41
42 sought to allow for a degree of correspondence between the researcher and the on-going
43
44 nature of the respondents' experience of place.
45
46
47

48
49 Practically, the researcher found that audio recording and taking photos was challenging
50
51 despite piloting of the equipment. Yet, using multiple forms of AV equipment whilst on
52
53 the move provided for an enriching data collection process. Recording equipment used
54
55 was a Zoom HN4 with windjammer to improve audio quality outside in windy
56
57 conditions. Audio files were professionally transcribed. Photographs were taken with a
58
59
60

1
2
3 digital SLR (DSLR) and spare batteries and memory cards were carried. With such
4
5 burdensome technology, notepads and written prompts were not practical but short
6
7 fieldnotes were also produced from memory soon after each walk.
8
9

10 11 **Teacher's Planning of Outdoor Learning: Vignettes and Data Examples** 12

13
14 The following data examples are provided as 'vignettes' (Ivinson and Renold, 2013;
15
16 Masny, 2013a, 2013b). Space here does not permit a fuller explanation but the vignettes
17
18 shared here are expressions of a post-qualitative orientation towards social science
19
20 research (See for example Lather, 2013; St Pierre 2014). The vignettes are presented as
21
22 assemblages (Fox and Aldred, 2014) of transcripts, photographs and fieldnotes, The
23
24 Vignettes need to be *read* as an assemblage with the transcripts, field notes and photos
25
26 working together to portray and disclose meaning. Following Jones (2013) we seek to
27
28 evoke and portray the evidence gathered in the walking interviews and, in particular, the
29
30 effects of the more-than-human which emerged as a significant theme in the data
31
32 analysis process. Vignettes were chosen because of their ability to introduce questions
33
34 for us as researchers and for subsequent readers of vignettes in the products of research.
35
36 In the vignette (assemblage) choice and in their reading, we propose that meaning
37
38 making is ongoing. The usefulness and validity of the vignette is in its ability to bring
39
40 forth new meanings through being both provocative and productive for any committed
41
42 reader and for us the researchers. As Masny (2013a) notes on vignettes:
43
44
45
46

47
48 It is a process in which there is an investment in reading, reading the world and
49
50 self. Instead of considering interpretation and what a text means, the questions are
51
52 what vignettes do and how do they function. (Masny, 2013a: 343)
53

54
55 The vignettes are presented along with tentative suggestions (Ivinson and Renold, 2013)
56
57 for analysis and are chosen for the power we feel they have to evoke, disclose, portray,
58
59 new ways of understanding. Our vignettes are revealing but seek not to directly
60

1
2
3 represent the collective assembled relations among the people involved, their worlds;
4
5 the human and the more-than-human. We hope the vignettes signpost for readers what
6
7 might be important about the more-than-human element in planning for outdoor
8
9 learning in other settings too. Vignettes, then, invite readers into a collaborative
10
11 witnessing of the role of the more-than-human (mammals, trees, plants, weather) in the
12
13 planning for outdoor learning. We note how teachers' ability to be place-responsive in
14
15 planning are connected to teachers' preparedness to notice, address and respond to
16
17 more-than-human aspects on these walks.
18
19

20 21 22 *Vignette 1*

23
24
25
26 The vignettes contain interview transcripts, photos from the walking interview, and field
27
28 notes. The first vignette is from a walking interview in the local forest behind the
29
30 school, which is an open and mature Scots Pine plantation. The forest is the main site
31
32 the teachers use for their regular outdoor learning. The forest is managed for
33
34 biodiversity by the National Trust for Scotland which includes some active badger setts
35
36 which are known to the teacher and children. This vignette portrays a surprising
37
38 encounter with the tracings of the badgers in the forest during a walking interview.
39
40
41
42
43
44
45

46 Figure 1 in Text Box
47
48
49
50
51
52
53
54
55

56 The first vignette portrays how the outdoor place provides a setting for learning that is
57
58
59
60

1
2
3 seen by the teacher as being full of varied differences – in this case tree species. In the
4
5 transcribed text, we hear how the differences in places afford a way of linking the static
6
7 knowledge – tree identification - to real lived experiences of changing landscape
8
9 features since they revisit the same site over different seasons. For this teacher,
10
11 ‘knowing that’ (static content knowledge) is translated into ‘knowing how’. In this case,
12
13 we can know that in the world something exists as a larch tree, but in practice in a real
14
15 place, the larch tree can be identified through interactions with the encounter with this
16
17 more-than-human element. This resonates with Ellsworth’s ideas around pedagogy and
18
19 place where she sees we are not just bodies but bodies “whose movements and
20
21 sensations are crucial to our understandings” (2005; 27). Paraphrasing Kennedy’s work
22
23 she writes about the way ‘bodies’ are assembled with the bodies of the users/viewers/
24
25 observers; “in a web of inter-relational flows in material ways” (Kennedy, 2003; 26)”
26
27
28 (2005; 27).
29
30
31

32
33 In this account, the presence of badgers impacts on the researcher and a discussion
34
35 ensues about how the teacher is prepared to work with this new found difference to
36
37 offer a view on how a new line of inquiry could be initiated with the pupils in ways that
38
39 might involve new relations with ‘experts’ beyond the classroom. The teacher’s
40
41 response suggests an orientation to using the traces of the badger as a way of recording
42
43 and classifying, objectifying the knowledge, seeking ‘facts’ about what the phenomena
44
45 might be but locating these explanations in a way that is tied to shared embodied more-
46
47 than-human encounters in a place they know well.
48
49
50

51
52 One reading of these data is that the process of curricular assembling is a collaborative
53
54 activity involving the agencies of humans and more-than-human elements. Here we see
55
56 interactions among the badgers, the documents of the official curriculum, the teacher’s
57
58 actions, the pupils’ expected participation and the engagements with others beyond the
59
60

1
2
3 school. This suggests place-responsive curricular assembling sets out to afford
4
5 memorable and meaningful forms of learning through the co-production of knowing
6
7 through human and more-than-human encounters.
8
9

10 11 *Vignette 2*

12
13 In this second vignette, at a different site in Scotland, the story unfolds of how
14
15 researcher and respondent gained a fleeting glimpse of a Sea Eagle at the end of the
16
17 walking interview. This occurred at a beach where the teacher hopes to build a bird hide
18
19 to allow the children to view these birds and other wildlife.
20
21
22
23
24
25
26
27
28
29
30
31
32

33
34 Figure 2 in Text Box
35
36
37
38
39
40

41 This vignette portrays how the more-than-human in the environs of this particular Island
42
43 school and local area are experienced as intertwined with the process of planning for
44
45 outdoor learning. As Ingold might put it, we see that the teacher seeks to correspond
46
47 with the habits and trajectories of other species. Corresponding with the more-than-
48
49 human, she uses certain sites and places because they have potential for animal and bird
50
51 sightings she wants the children to see. This correspondence with the more-than-human
52
53 extends to her actions and desires to build a bird hide with the help of local experts in
54
55 order to see more wildlife with the children. The walking interview provides
56
57
58
59
60

1
2
3 opportunities for collecting data on the way the raptors in this place seem to nudge the
4
5 curriculum making of teachers, the children, and locals in particular directions. This
6
7 vignette in particular, with the Sea Eagle appearing just as we were leaving the site, is
8
9 an example of the chance encounters, the fleeting contingent unplanned glimpses that
10
11 outdoor sites like these offer.
12

13
14 How educators respond and prepare to respond to contingent place experiences seems
15
16 very important here. Critically, perhaps, this teacher welcomes this potentiality in her
17
18 practice. Also relevant are her local place knowledge and the efforts made to make
19
20 repeat visits which enable the teacher's correspondence with the more-than-human and
21
22 her attunement to place to be honed. Place-responsiveness through attending to the
23
24 more-than-human is not merely an outdoor concern. The silhouettes on the roof of the
25
26 classroom (see field notes) in this vignette remind us of the connected nature of indoor
27
28 and outdoor places connecting a sequence of activities that might afford learning
29
30 through responding with and to the more-than-human and the landscape around the
31
32 school.
33
34
35
36
37

38 Openness to the alterity of the more-than-human and the generation of deep place
39
40 knowledge over time seem necessary for this teacher to be able to respond to the more-
41
42 than-human in ways that are interwoven into the planned pedagogical experience of
43
44 landscape. Wattchow and Brown (2011) identify that if we are to harness place
45
46 pedagogically then as educators we are required to have "a sense of timing and a feel
47
48 for the possibilities in our immediate surrounds" (2011; 185). This vignette suggests
49
50 that some encounters with the more-than-human – perhaps especially so when outside
51
52 the classroom – are more likely when one is on the move. Encounters were fleeting and
53
54 involved noticing the subtle traces. Our sense is that a teacher's expertise includes a
55
56 keenness to learn about where to look as well as what to look for ahead of
57
58
59
60

1
2
3 considerations about how to work with these experiences. The walking interview
4
5 afforded opportunities to witness the dispositions and orientations of the educator when
6
7 attempting to educate with and in a world that is in formation, and their efforts to
8
9 harness their effects into an unfolding process of curriculum making.
10

11 12 13 *Vignette 3*

14
15 This last vignette focuses on the events that transpired near some disused and
16
17 overgrown curling ponds the teacher found when she was with the children at their local
18
19 outdoor learning area of semi-natural woodland. The assembled vignette evidence
20
21 portrays the nature of reciprocal responsiveness among various becomings over time:
22
23 children-place, teacher-children, and teacher-place.
24
25
26
27
28
29
30
31
32
33
34

35 Figure 3 in Text Box
36
37
38
39
40
41

42 This vignette portrays how the more-than-human possibilities in the place were able to
43
44 change the course of an outdoor learning session. We see how the teacher explains how
45
46 she changed her enactment of outdoor learning because of the frogs and how she saw
47
48 this as still a successful educational encounter. These data disclose how the educational
49
50 potential of the more-than-human in outdoor learning is harnessed in part, through how
51
52 the teacher herself is again, attuned to place. In addition, we see how in terms of
53
54 curriculum making this teacher is open to responding to the place through the children
55
56 and how the children were fascinated by the ruins at the old curling pond. Catling's
57
58
59
60

1
2
3 (2013) empirical work with the primary school geography curriculum notes how
4
5 children have their own 'geographies' that teachers can harness into a concern with
6
7 places in their curriculum making. We notice that teacher's responses to place are in
8
9 part generated through their concern for children's interests and their interactions with
10
11 more-than-human entities found within place. This intertwining of the more-than-
12
13 human and the pupils, the frogs and the curriculum are an example of the assembling
14
15 forces we understand to be at work. The walking interview as method allowed for
16
17 glimpses of this assembling process and how teachers disclosed their practice of
18
19 curriculum making as part of such an assemblage. This vignette indicates the nuanced
20
21 nature of teacher's responsiveness to place and how 'in the moment' a given response to
22
23 the more-than-human unfolds in the world and generates pedagogical implications.
24
25
26

27
28 These data, as we interpret them, tell us that curriculum making is an eco-social
29
30 material practice. It involves teachers responding to places that change over time, with
31
32 the other species found there, with the effects of the seasons and with the weather. In
33
34 turn, these places change in response to the place-making activities of children and the
35
36 teacher: planting, picking, hiding, climbing.
37
38
39

40 **Walking Interviews: Empirical Research and Our Approach**

41
42
43 These vignettes show the potential in the methodology and walking interview method
44
45 described in capturing evidence of place-responsive correspondences with the more-
46
47 than-human. The walking seemed to open up the teachers' thinking and afforded
48
49 opportunities for agencies of the more-than-human in place to co-produce the evidence
50
51 used above. The materials and features of the outdoors as we walked became relevant to
52
53 the discussions; it seemed we both (interviewee and respondents) came to pay attention
54
55 to the more-than-human (ecological and other material) aspects that may have been
56
57
58
59
60

1
2
3 forgotten in a more sedentary interview based indoors. Ingold calls this knowledge
4
5 creation through movement in the world “wayfaring” (2011; 148). For Ingold, it is less
6
7 that place itself (as container or context) is important than the movement through/along
8
9 places “The path, and not the place, is the primary condition of being, or rather of
10
11 becoming” (2011; 12). We see the importance of the path, the walking, as an important
12
13 way of understanding how we come to know the world. Sharing this walk with the
14
15 teachers and setting out to encounter the place as a site of practice and *possibilities* is
16
17 where we see the richness in this method. Critically there are practices and knowledges
18
19 that are *not place based* that we missed and did not pay attention to. Although Ingold
20
21 argues that it is in moving through the world (wayfaring) that knowledge is created
22
23 “scientific knowledge, as much as the knowledge of inhabitants, is generated within the
24
25 practices of wayfaring” (2011; 155) for us we acknowledge that we are in some ways
26
27 privileging the place-responsive practice knowledge that this method collected data on.
28
29 We acknowledge that in these data examples, we have privileged the way the teachers
30
31 were seeking to move with the flow of knowing that was enfolded with and through the
32
33 processes of place making. They had come to know and understand the nature of
34
35 planning for and enacting place-responsive curriculum making through their on-going
36
37 ‘apprenticeship’ (Wattchow & Brown, 2011) to particular places.
38
39
40
41
42
43

44 As we have framed it and deployed it, we suggest that the walking interview is a very
45
46 legitimate method to research these relations and the method produces one viable way
47
48 of noticing our participation in places including how we come to know through them.

49 As a tool, we suggest, these kinds of walking interviews and data analysis can help to
50
51 overcome some of the challenges of representation that exist in how we ontologically
52
53 understand nature (Castree, 2004; Thrift, 2006). We consider this approach to be one
54
55 response to the call to be more sensitive to the challenge of apprehending the world
56
57
58
59
60

1
2
3 (rather than fixedly representing it) because it and the research process are both in flow
4
5 (Hall, 2009; Shelley and Urry, 2006).
6
7

8 In our vignettes, we noticed how the more-than-human came to be an important part of
9
10 what was noticed and harnessed by the teachers. Some of these teachers were only
11
12 somewhat self-aware of these processes. Some more actively sought to harness the
13
14 more-than-human into their pedagogies. Hinchliffe, Kearens, Degan and Whatmore
15
16 (2005), and Ingold (2000) suggest there are quite diffuse boundaries between the
17
18 'human' and 'animal'. Based on our evidence, education in outdoor settings is likely to
19
20 require more explicit acknowledgement of the more-than-human in teacher education
21
22 and in-service professional development.
23
24

25
26
27 We are finding walking interviews are a useful approach to use to collect data to
28
29 understand the role of the more-than-human in teachers' planning and enactment of
30
31 outdoor learning. Data from walking interviews helped us correspond to how the
32
33 teachers saw, experienced and responded to a world that was in flow or in formation.
34
35 The teachers' commentaries and responses to the event of the walking interview helped
36
37 us understand how they were disposed to and encouraged their learners to utilise
38
39 experiences of places to gain new understandings. The data analysis supported the view
40
41 that for some teachers, knowing and becoming with and in place could viably be
42
43 intertwined within formal educational experience outdoors; their approaches to planning
44
45 and curriculum making showed sensitivity to learning as a process that emerged with
46
47 and through the flow of place.
48
49
50

51 52 53 **Conclusion**

54
55
56 Educational practitioners can be key players in the assembling of place-responsive
57
58 curriculum making. To do so we need to know how the more-than-human is to be
59
60

1
2
3 noticed, attuned to and harnessed within the assembling learners, technologies, formal
4 curriculum intentions and place elements: "Practitioners, I content, are wanderers,
5 wayfarers, whose skill lies in their ability to find the grain of the world's becoming and
6 to follow its course whilst bending it to their evolving purpose" (Ingold 2011; 211).
7
8 Mannion, Fenwick and Lynch (2013) found that teachers consider place in planning
9 outdoor learning to various degrees: they can be place-ambivalent, place-sensitive, or
10 place-essential. In practice, being assembled with and in a place is unavoidable whether
11 indoors or out. But being open to, noticing and harnessing the agencies of relations with
12 others and with the more-than-human is undoubtedly a key disposition for educators in
13 outdoor places. We suggest that this will be increasingly important if we are to use
14 place-based experiences to understand and improve human-environment relations. In
15 these cases, we notice how the teachers who developed this disposition to a greater
16 degree were also the ones who had spent considerable amounts of time outdoors, had
17 on-going connectedness with other local people and experts, and importantly, were able
18 to enlist the agencies related to the more-than-human into their plans and pedagogies
19
20 These findings suggest there is more to learn about how places can be harnessed
21 effectively into place-responsive pedagogy especially when outdoors. We argue that
22 using a place-responsive methodology is one way to significantly contribute to this in
23 research. But our experience also suggests that many different methods would likely be
24 differently evocative yet just as revealing. Using a walking interview method we were
25 able to gain some understanding into the what, and the how, of a teacher's educational
26 planning when taking their pedagogy outdoors, and how the more-than-human were
27 part of that encounter.
28
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54

55
56 We have explored one line of thinking that allows us to make claims on the importance
57 of place in outdoor educational provisions. We have suggested, in addition, that this
58
59
60

1
2
3 onto-epistemological framing of knowing through wayfaring is suggestive of a need to
4
5 respond differently to place in the ways we teach outdoors and research outdoor
6
7 experience and outdoor education. We have exemplified our methodological position
8
9 and described one way of conducting empirical data collection and analysis that takes
10
11 these ontological concerns seriously. The walking interview method is but one of a
12
13 range of emerging ways of responding to the problems of representation.
14
15

16
17 New research methods and methodologies are needed to be open to registers of meaning
18
19 that are not limited by the dominance of the human or merely cognitive processes.

20
21 Going forward, we suggest place-responsive research methodologies will benefit from
22
23 an experimental approach. Whatmore identifies a challenge, and requirement, of
24
25 research orientated towards the more-than-human is to be able to experiment and take
26
27 risks – especially in methods. She calls for a breakaway from humanist methods of talk
28
29 and text and a move towards other “that amplify other sensory, bodily and affective
30
31 registers and extend the company and modality of what constitutes a research subject.”
32
33 (2004; 1362)
34
35
36
37

38
39 In the developing fields of outdoor education, adventure education and outdoor learning
40
41 the walking interview as described here and other methods have great potential in
42
43 encouraging ways of allowing for the more-than-human elements to be implicated in
44
45 research processes. In the outdoors we are very often ‘on the move’, whether it is within
46
47 an adventurous activity, on journeys or expeditions, or indeed, in urban settings. Place-
48
49 responsive research methodologies can help deepen our understanding of how the
50
51 significance of being outdoors impacts on planning for learning and the ongoing flow of
52
53 pedagogical decision making. We advocate for further advances in place-responsive
54
55 research to help deepen our understanding of how outdoor places of all kinds are
56
57 educationally distinctive
58

Walking Interview Transcript Excerpt

Interviewer. So what would be distinct about what you might do here?

Respondent Well if you are doing tree ID, they all know about larch, and we have got little rhymes that we know about different trees, so larch is lumpy, lumpy larch and so ... if you are going to do larch you are not going to sit with a smart board with pictures of larch, going “this is a larch tree”. You come up here for a walk and you do your tree ID. They only know three or four but that is something you should do up here. But if it is like a measuring activity on metres and half metres which you could do on school grounds, there is not a lot of point. I am not saying there is not a lot of point coming up here, but I think that the place does matter and there is so much variety that we have got. We have got a massive site. We come down here a lot because ... this is our ... down here you will ...

[Interviewer - looking down at my feet, I notice these marks on the ground – see picture]

I. Is that badgers?

I Is it hoof prints? Or noses?

R Nose marks. This is really far from the sett.

I If you came across that with the children, would you talk about it?

R We would stop and ask and we use photography so that if we don't have an expert or don't have a definite answer we can take it back and we email.

From Researcher Field Notes (Post Walking Interview)

The way I started to talk about the research project in the middle of the interview seemed to change the mood – lighten it up a bit. Also the walking and the ‘take me on a tour’ approach seemed to bring immediate place features/events to our attention so that we could talk about them and the implications for curriculum planning and enactment. The place aspects were more than about memory, it felt that we could talk about things that are not yet fully expressed or used in these processes of curriculum planning and enactment such as the badger nose snouts and the telephone mast. And the last point about how she sensitises the children to the wood – at that point she looked at the wood in a puzzled way...

Getting behind the planning is hard work

She doesn't tell the story of the place very well...there is a lot going on with the different narratives. The interview process was helped by me interjecting with my thinking and aims...the place walking interviews acts as a stimulus –so does the material and the more-than-human .

Photograph 1- Badger nose marks from Walking Interview

Walking Interview Transcript Excerpt

Respondent. We have seen different kinds of wildlife. Birds particularly. The other side of here, I am not going to take you there now because it would actually be too far. The other side of this site, there is an old boathouse. And we are hoping with the aid of the local bird club to make that into a sort of bird hide.

Interviewer. Good

R And it looks out over the estuary. Over the beach. I will show you as we are going back. That again is another area that we are going ... for bird watching and looking more at the bird life around here and hopefully we might see some otters as well while we are here.

I The eagles are impressive. I have seen a sea eagle once before. An amazing bird.

R Well as you are driving back, have a wee look ... from our school window we see Sea eagles, we see Hen Harriers, there was a Hen Harrier just earlier this morning out there. We see lots of lapwings and Canada geese, and Grey Lag Geese and ... just in the field opposite. The kids are quite ... we did the big bird watch this year and we were lucky enough to be able to put a Hen Harrier on ...

Photograph 2 – Fleeting Glimpse of Sea Eagle**From Researcher Field Notes**

On the return to the school, in the main classroom there was the huge view out of the window looking east to Ben [mountain]. On the classroom ceiling there were three black life-sized paper silhouettes of three raptors: Hen Harrier, Buzzard and a Sea Eagle, in size order. These were for the children to look up at and compare the bird sizes to each other and themselves.

Is this the outdoors, the more-than-human, leaking into the classroom? Why choose raptors? I think because they are significantly rich life forms in terms of education and examples of the wonderful nature here – and that the outdoors, the more-than-human aspects of place are 'leaking' indoors. Using Ingold (2010) I could understand these in two particular ways. One, as an example of a line of life/living, the livingness of the Raptors that includes their life in the wild and the way that flows back into the classroom via the black paper and the silhouettes on the roof. Secondly, that though the making of these paper silhouettes the people who made them (teachers and pupils?) would have been haptically exploring the form, shape and size of the birds.

3 **Transcript Excerpt from Walking**
4 **Interview**

5
6 **Respondent.** Even just walking up this
7 kind of area, it is all boggy and there is lots
8 of frogs and things in the spring time. I did
9 take the class up there and we went
10 looking for plants and we ended up finding
11 more frogs and having a much more
12 interesting time looking for frogs. I think
13 that might be something to do with the
14 curling pond. I don't know.

15
16
17 **Interviewer.** The curling pond is up
18 there?

19
20 **R.** ...As you can see this is the
21 building that fascinated them. Whether it
22 was a hut for the curling stones, and
23 whether this boggy area was the original
24 curling area, it could be. From the shape
25 of the landscape. I think this is the area the
26 community are suggesting that they re-dig
27 out the pond and use it for pond dipping
28 and if it does freeze over in winter, which
29 it certainly wouldn't have done this winter,
30 it could be used for community curling. It
31 is a stone's throw from the school, I could
32 be up here every day if I wanted to in the
33 spring time. And there is certainly a lot of
34 frogs in that boggy area. Plants got
35 ditched for the frogs. But that is learning
36 as well.
37
38

39
40
41 **I** You turned up here with an idea of
42 doing plants and ...

43
44 **R** We did, we did do a lot with the
45 plants, and the kids recording them with a
46 digital camera and then if you are familiar
47 with the great plant hunt, you go back to
48 school and you load up the photographs,
49 and you look at ... it is the Kew Gardens
50 website ...

51 **From Researcher Field notes.**

52 *The curling ponds were part of a*
53 *collaborative project where the children*
54 *and Teacher D discovered them together –*
55 *they went to look at plants but found frogs*
56 *and that started a trajectory of looking at*
57 *frogs and the site as a past communal*
58 *curling pond, now overgrown.*

59 *She really sounds very responsive and*
60 *talked about the places giving her ideas as*
she goes and responding to wildlife (frogs
in the curling pond). One other significant
point is that she says she needs to sensitise
pupils to the outdoor areas as these are
not really outdoor children and on first
forays outdoors they just went giddy and
scattered.
