EXPLORING THE RELATIONSHIP BETWEEN ONLINE SERVICE FAILURE, RECOVERY STRATEGIES AND CUSTOMER SATISFACTION

Dipen Rai
University of the West of Scotland, UK

And
Wilson Ozuem
University of Cumbria, UK

Abstract
This paper aims to analyse perceptions of online service failure-recovery and customer retention in relation to the creation of satisfactory experiences for both customer and providers in the banking sector. In specific, the negative impacts of service failures and the positive effect of recovery strategies are assessed. Online service failures can have adverse impacts on profitability, and on- and offline service failures are inevitable in the service industry. A number of observations are made with implications for customer and provider experience in the banking sector. The purpose of this paper is to divulge predominant academic insight into a consistent provider-customer interaction and unlocks new perceptions for future academic study by examining the phenomenon from the perspectives of both providers and customers.

Keywords: Online service failure, Service recovery, Customer satisfaction, Customer retention, Post recovery behaviour, Banking sector

INTRODUCTION
Service failures can be defined as faulty results which reflect a breakdown in consistency (Berry & Parasuraman, 1992). Similarly, service failures have been defined as “service performances that fall below customer expectation” (Hoffman & Bateson, 2010, p.327). Others have described service failure as any service associated calamity or trouble that occurs
during the experience of a consumer in their dealings with a company (Maxham, 2001). Some researchers have argued that it can be expensive for service providers to delay tackling service failures. Such failures can also lead to consumer refusal (Liu et al., 2000; Maxham, 2001; Kotler & Keller, 2011). The idea of online service failures is based on ECT (Expectation Confirmation Theory) and can be defined on the basis of the conventional “gap” framework of service quality (Oliver, 1980; Parasuraman et al., 2005). Online service failure is defined as “the gap that occurs when customers’ perceived quality of service delivery does not match their service expectations” (Tate et al., 2014, p. 2). E-tail consumers experience various online service failures as compared with their conventional retail counterparts (Kelley et al., 2005). Consequently, novel failure recovery strategies are essential in order to deal with online service failures.

The literature on service failure and recovery strategies focusses on understanding the perspectives of customers surpassing explanations from the provider’s viewpoint (Parasuraman et al., 2005; Zhu et al., 2013). The provider’s outlook is often anticipated and can be approached from the perspective of two different types of performers which are enacted in order to enrich the experiences of customers (Grewal et al., 2008; Huang et al., 2013). Consumers have been conceptualised as entirely same experiences through the service failures and recovery strategies with limited exceptions that affects the subjective fact in the occurrence (Maxham & Netemeyer, 2002). Earlier studies have suggested that failure severity and critical failure have asubstantial impact on consumer satisfaction. These can lead to adverse word-of-mouth communications and reduced levels of consumer loyalty. Previous studies (Jones et al., 2004; Azemi & Ozuem, 2016) have investigated the effect of service failure severity on trust, loyalty, consumer satisfaction and negative word-of-mouth. Research has found that service failure severity has a substantial effect on consumer trust, loyalty and adverse word-of-mouth. Likewise, Kim and Ulgado (2012) investigated the perspectives of consumers in relation to service failure severity, repurchase behaviour and recovery satisfaction in hospitality services. They concluded that service failure severity has a substantial adverse effect on consumer repurchasing behaviour.

**CONTEXTUALISATION: ONLINE SERVICE FAILURES**
A complete outline of the literature ascribes the experience of service failure-recovery to a five-stage procedure that is service failure occurs, recovery expectations, provision of recovery strategies, evaluation of recovery and post-recovery behaviour. Conversely, understanding of the consumer is prominently related with particular process stages affecting descriptions inherited to the missing stage (Mohr et al., 2006). Accordingly, experience of consumers accounts for particular backgrounds exceeding the possibility of further descriptive aspects (Rio-Lanza et al., 2009; Mattila & Choi, 2008). It is revealed from above-stated that the literature has been established in a context-free method from a positivist ontological view and responses of consumer are highly concentrated and organised. It indicates that the service failures and recovery strategies phenomena are related with a iterative experience. Moreover, the experience of the customer is anticipated during the service failure-recovery. Consequently, Miller et al. (2000) illustrated that the literature on the service failures and recovery strategies are recognised with the attempts of academics to assign the customers’ perceptions in service failures and recovery to the objective fact.

Nevertheless, the literature sets out some contrasting and contradictory outcomes. It advises that consumers are heterogeneous and need to be managed subjectively (Diaz-Martin et al., 2008; Wang et al., 2011; Azemi & Ozuem, 2016). The existing literature on service failure and recovery strategies sets out a number of advantages associated with service recovery. Rust & Oliver (2000) argue that suggestive outcomes affirm that acceptable recoveries might be harmful to the service provider. This provides an indication of how distinctive consumers are from a realist perspective. The author suggests a contextual method for understanding service failure and recovery strategies which places the consumer at the heart of analysis. The literature on service recovery also follows a particular epistemological orientation (McCarthy et al., 2011). Electronic media literature appears to have established the underpinnings to research into service failure and recovery strategies, while the evolution of the internet has exposed offline service failures and recovery strategies from the perspective of traditional offline practices (Salle et al., 2015; Ozuem et al., 2016). It has been suggested that Computer-Mediated Marketing Environments (CMMEs) have empowered society, and have allowed consumers to develop insights highly individualised orientations to the world of consumerism (Ellis-Chadwick & Chaffey, 2012). This underscores the subjectivity of the insights of consumers and relates service failure and recovery strategies to experiences of impulsive results. Moreover, the practice of providers observing consumers has also been highlighted and authors
have related service failure-recovery occurrences to the combined experience created between
the customer and the provider.

Ozuem & Lancaster (2013) attributed the service failure-recovery experience to interactions
between consumers and others as part of the process of social constructivism. The present
study suggests that service failure, recovery expectancy and appraisal, as well as after-recovery
actions are formed through interactions between consumers and providers. This suggests
that individuals constantly accept the latest information that matches and substitutes the inherited
characteristics. This contrasts with work undertaken by Ringberg et al. (2007) since the present
research does not separate out the inherited characteristics of customers before service failure
occurs. This study views service failure and recovery strategies as combined initiatives that are
carried out in concert between providers and consumers. It evaluates service failure-recovery
from the perspectives of both customers and providers in order to develop an understanding of
the topic. The study presents a contextual and inclusive conceptualisation of consumers during
service failure-recovery procedures. The researcher is not isolated from the research context
because a social constructivist approach is used. Strauss (1988) states that such an approach
links data enrichment to the empirical data of the researcher. Maxwell (2012) illustrated that
empirical data can include the personal and professional experiences of the researcher as part
of the studied phenomenon. The personal, professional experiences and background of the
researcher have therefore directed the current study which is produced in the context of online
service failures and recovery strategies in the banking sector of Nepal. Nepal is a developing
country and Ringberg et al.’s study is limited to only the developed nations. Therefore,
investigating online service failures and recovery strategies in the Nepalese banking industry
represents a timely addition to the existing literature.

Academics have identified descriptions of service failure-recovery occurrences based on
feedback from customers (Wirtz & Mattila, 2004; Vazquez-Casielles et al., 2008). Similar
approaches and comprehensions of the scholars’ tendency during the service failure and
recovery strategies procedures overlook the literature (Cheng et al., 2012; Huang et al., 2014).
This type of positivist orientation creates limited explanations as to the specific antecedents
and process phases associated with service recovery (Chou & Lai, 2015). Furthermore, it is
related the occurrences to an iterative experience as well as behaviour and reactions of
consumers to an expectable one. The positivistic approach to understanding consumers appears
to have obstructed the clarifications inherent to the key theory. Regardless, academics have
attempted to understand service failure and recovery strategy occurrences from various theoretical approaches such as justice and appraisal theory (Azemi & Ozuem, 2016; Mohr et al., 2006; Zhang et al., 2013). The above-stated developed contradictory outcomes in the studies relating the occurrence with complicated issues (Choi & Choi, 2014). It indicates, focus to customer’s perspective, the descriptions on how in reality consumers acquire service failures insight and recovery expectation and assessment to construct after-recovery behaviour decisions are confined. Therefore, the present research paper approaches consumers as heterogeneous and it relates the conceptualisation of the customer’s perspectives on service failure-recovery to state of their mind.

SERVICE RECOVERY IN BANKING SECTOR

It is essential to rectify the problems of service failures in the banking sector on account of the costs associated with gaining new clients. Such costs are five times higher than the costs associated with the retention of current clients (Maxham, 2001; Gitomer, 2013). Such high costs are associated with the expensive nature of marketing activities required to attain new clients. Furthermore, service providers could harm the long-term success of their business if they are unable to recover service failure properly (Magnini & Ford, 2004). Accordingly, Tschohl (2013) stated that an effective recovery strategy can reduce negative feelings and increase positive sentiments amongst customers.

According to Jan & Younas (2012), service recovery is essential in the banking industry. They argue that “customers may avoid complaining about minor service failures, however, in the financial institutions like banks there are no minor service failures as it is the dealing of money” (Press et al., 1997, p. 74). Moreover, a study of the Australian banking sector found that customers do not tolerate minor service failures, for instance charging additional fees on their accounts. The findings of the study advised that banks must make an effort to deliver their services appropriately on the first occasion to avoid unsatisfactory service experiences (Valenzuela et al., 2013).

Consumers are likely to switch banking service providers if the service recovery they experience does not fulfil their expectations (Zeithaml et al., 2012). However, it has been argued that customers are likely to publicize more intense negative sentiments if they do not perceive of a sufficient level of service recovery following service failure (Neira et al., 2010;
Ayertey & Ozuem, 2017). Therefore, service recovery can be approached as a second opportunity for the service provider to address failings as soon as they occur (Bowen & Johnston, 1999). The efficient management of failure has an effect on the satisfaction of customers and their intentions to switch service providers (Ahmed & Amir, 2011). Service failure recovery is considered a key factor behind the customer’s decision to switch service provider (Azemi & Ozuem, 2016).

**MANAGERIAL IMPLICATIONS**

Studies of online service failure and recovery strategies first emerged earlier this century and so the topic has not been fully and adequately conceptualized (Boroumand et al., 2008; Fan et al., 2010). Researchers have attempted to transfer some of the conventional wisdom associated with offline failure recovery literature to online settings with mixed success (2014). Descriptions of service failures and recovery strategies emerge to be apparent as they affect the risks and opportunities accredited to the multifaceted type of digital setting (Piercy & Archer-Brown, 2014). The existing literature on service failures and recovery strategies shows that failing to understand the consumer is main reason for the ambiguity and complications that have been identified by academics and specialists (Netemeyer & Maxham, 2002; Lo & Wu, 2012; Zhu et al, 2013). This would suggest that comprehending service failures and recovery experiences from an online perspective is essential to create positive recovery platforms. The above discussion emphasizes the need to comprehend and relate service failures and recovery to hypothetical situations leading the present researcher to explore the phenomenon comprehensively.

The present study delivers substantial indicators for managers in the service sector. Apologizing, compensation, confirming a speedy response to the consumers and following-up have been acknowledged as effective recovery strategies in order to increase consumer satisfaction (Smith et al., 1999; Gelbrich & Roschk, 2011). The findings advise that the businesses should have possible recovery strategies that they may implement in order to resolve service failures. Service failure is usual and consumers may experience disappointments in the service industry after failure occurs. Therefore, it is essential that managers should train employees to respond to disappointed consumers with a recovery compensation in a way that expresses sincere regret for the service failure (Lastner et al, 2016).
Other managerial implication, developing from the current study have in reaction to service failures is the usage of apologies, which are not just anticipated by affected consumers, but are also advantageous in reinstating organizational reputation particularly in the context of service failure. Such a gratitude may enhance and enable the process of managerial decision-making comprising communication selections expected at strengthening relationships with consumers (Salvador et al., 2012). Moreover, the impact of recovery strategies on the revenue of the firm can be important and maintaining decent relationships with existing customers is a crucial strategy (Ozuem et al., 2017).
